

Primal Technologies was an early pioneer of many Unified Messaging features including voice-to-email, fax-to-email, and WWW-based voice and fax mail feature management and message viewing. Primal Technologies further enhances the Unified Messaging experience with support for both the Apple iPhone native VVM client, and the Primal Technologies provided Android client. With either client, subscribers can now easily manage all of their new and existing voice messages through an easy to use, intuitive smartphone app user interface.

The Primal Apple/ACME VVM interworks with the Primal Technologies SMSC (or other 3rd party SMSC) for the exchange of VVM status and control messages with the handset VVM client. Full app/server synchronization is included.

Primal Technologies also gives the operator complete control over the type of message waiting mechanism that can be enabled on a per user/template basis (e.g. Traditional SMS, Apple iPhone SMS WAP push, Android GCM).

The Primal Advance Pay/Prepaid Balance, Rate Plan, Expiry / Billing cycle end date can also be shown (i.e. Configurable - See bottom banner in sample Android screenshot below).

Customer logos / branding available.
